

# Madagascar The Mini Continent

Show length : 35 minutes

Ours was the first ever flying safari to Madagascar: October 2013. Madagascar is actually a mini-continent, larger than France, containing the world's most bizarre and diverse flora and fauna along with some otherworldly landscapes and geology.

The lemur is the [INDRI], Madagascar's largest lemur. One of the world's most endangered primates.

In our 18 days there, we were able to see and photograph many of the endemic species. Shown will be Lemurs, including the dancing ones, reptiles, geckos and plenty of birds.
